

Project Description

NIVRA – AI-Powered Smart Complaint Management System is an intelligent mobile application designed to simplify and modernize the process of complaint registration and grievance management. The project aims to provide citizens with a centralized digital platform where they can easily submit complaints, track their progress, and communicate with the concerned authorities without relying on traditional paper-based or manual procedures.

The primary objective of NIVRA is to make complaint management more transparent, efficient, and accessible. Instead of visiting government offices or making repeated phone calls to check complaint status, users can perform all these tasks through a single mobile application. The system is designed to improve communication between citizens and service providers while reducing delays and increasing accountability.

The innovative aspect of NIVRA lies in its integration of **Artificial Intelligence (AI)** into the complaint management process. Unlike conventional complaint applications that only collect and store complaints, NIVRA is envisioned to intelligently analyse complaint descriptions, identify their category, determine their priority level, and assist in routing them to the appropriate department. This reduces manual effort, improves processing speed, and enables faster resolution of citizen issues.

Another key innovation is the combination of **cloud-based technologies** with an intuitive mobile interface. Secure user authentication, cloud data storage, and real-time information management ensure that users can access their complaint records anytime and from anywhere. The application is also designed with a modular architecture, allowing additional features such as image-based complaint submission, AI-assisted recommendations, real-time notifications, location-based services, and offline data synchronization to be integrated seamlessly in future development.

By combining mobile technology, cloud computing, and artificial intelligence, NIVRA aims to transform the traditional grievance redressal process into a smarter, faster, and more user-centric digital solution. The project demonstrates how modern technologies can be leveraged to enhance public service delivery, improve transparency, and create a more efficient complaint management ecosystem.
